**Subject:** OVQT Mission Compiler plugin build fails on Debian-based Linux distributions.

### Description

Per this thread:

<http://dev.ryzom.com/boards/17/topics/5442?r=5497#message-5497>

The build is failing due to two problems: stricmp is not referenced with the explicit NLMISC namespace and the Qt 4.6.3 uic is not validating supported property names. By using the placeholderText property in the .ui file uic is automatically generating a source file with a call to 'setPlaceholderText' - this property is unique to Qt 4.7+ and since it is autogenerated cannot be suppressed conditionally.
