Subject:	WebTT: Raw file import files to import files from a sub-directory on Windows.		

Description

WebTT is configured to point at the 'translation' folder from Ryzom which has a structure like this:

- translation
  - translated
  - diff
  - work

If I import a raw file such as *wk.uxt* from a subfolder such as translated the file that it imports is "translated\wk.uxt". When you import this the URL becomes:

http://webtt.somewhere.com/admin/raw_files/import/translated\wk.uxt

The result is a 404 Not Found error because the \ breaks the parameter path. The file name needs to be sanitized for Unix-style paths before being appended to the 'Import' link.
